  Troubleshooting Tips ............................................... 41
Welcome aboard your new powerbase wheelchair, and thank you for choosing our product. Please read this manual carefully, and follow all instructions before attempting to operate your powerbase wheelchair for the first time. If there is anything in this manual that you do not understand, or if you require additional assistance for setting up your powerbase wheelchair, please contact your local dealer.

This latest model is designed for specific practical user needs, combining solid, rugged construction, and modern high-tech electronics, to enhance safety and performance.

With a state-of-the-art, programmable electronic control system, your powerbase wheelchair can be programmed and adjusted within a given range of its performance characteristics, to suit your individual needs. The controller is set up at the factory to give the powerbase wheelchair nominal operating performance characteristics.

After becoming familiar with the basic operation of the powerbase wheelchair, you may wish to customize the settings to fit your own personal preferences. A wide range of customization options can be adjusted such as acceleration, deceleration, maximum speed, turning speed, safety controls, better maneuverability of the joystick, and so on. Contact your local dealer for advice on additional equipment you may need.

Having your powerbase wheelchair checked regularly by your local dealer is the best way to ensure smooth operation, and safety.

This manual provides users practical tips and information on safety issues, operation, and maintenance. Please read it very carefully to ensure your maximum enjoyment and to fully benefit from your independence and mobility.

Whenever special advice or attention is needed, please do not hesitate to contact your local dealer, who has the tools and know-how to provide expert servicing for your powerbase wheelchair.

Your satisfaction and opinions are highly valued by both your local dealer and our company. Please be sure to fill out the enclosed guarantee form, and return it to your local dealer. The information is necessary for providing you with the best service, and to help us ensure that all of your needs are met.
Failure to follow these instructions may result in damage to the powerbase wheelchair or serious injury.

**Practice Before Operating**

Find an open area such as a park and have an assistant to help you practice until you have confidence operating this vehicle.

Make sure that the power is off before getting in or out of the seat. Set the speed control button according to your driving ability.

We recommend that you keep the speed control at the slowest position until you are familiar with the driving characteristics of this vehicle.

Getting familiar with this vehicle

First, practice moving forward. Be sure to set the speed to the lowest setting.

After becoming familiar with moving forward, practice making "S" turns.

Once you are familiar with "S" turns, practice moving in reverse. Note that at any speed control setting, the vehicle moves more slowly in reverse than forward.
Safety Considerations

DO NOT do any of the following

**NO!**
Do not carry any passengers

**NO!**
Do not drive across a slope

**NO!**
Do not drink and drive
Consult your physician to determine, if your medications impair your ability to control this vehicle

**NO!**
Do not tow a trailer

**NO!**
Do not turn on or use hand-held personal communication devices such as citizens band (CB) radios and cellular phones
This vehicle has an immunity level of 30 V/m which should protect it from Electromagnetic Interference (EMI) from radio wave sources. The rapid development of electronics, especially in the area of communications, has saturated our environment with electromagnetic (radio) waves that are emitted by television, radio and communication signals. These EM waves are invisible and their strength increases as one approaches the source. All electrical conductors act as antennas to the EM signals and, to varying degrees, all power wheelchairs and power scooters are susceptible to electromagnetic interference (EMI). This interference could result in abnormal, unintentional movement and/or erratic control of the vehicle. The United Statement be incorporated to the user’s manual for all electric power wheelchairs.

Powered wheelchairs and electric power scooters (in this text, both will be referred to as powered wheelchairs) may be susceptible to electromagnetic interference (EMI), which is interfering electromagnetic energy emitted from sources such as radio stations, TV stations, amateur radio (HAM) transmitters, two-way radios and cellular phones. The interference (from radio wave sources) can cause the powered wheelchair to release its brakes, move by itself or move in unintended directions. It can also permanently damage the powered wheelchair’s control system. The intensity of the EM energy can be measured in volts per meter (V/m). Each powered wheelchair can resist EM up to a certain intensity. This is called the "immunity level." The higher the immunity level, the greater the protection. At this time, current technology is capable of providing at least 30 V/m of immunity level which would provide useful protection against common sources of radiated EMI.

Following the warnings listed below should reduce the chance of unintended brake release or powered wheelchair movement that could result in serious injury:

1) Do not turn on hand-held personal communication devices such as citizens band (CB) radios and cellular phones while the powered wheelchair is turned on.

2) Be aware of nearby transmitters such as radio or TV stations and try to avoid coming close to them.
3) If unintended movement or brake release occurs, turn the powered wheelchair off as soon as it is safe.

4) Be aware that adding accessories or components, or modifying the powered wheelchair, may make it more susceptible to interference from radio wave sources. (Note: there is no easy way to evaluate their effect on the overall immunity of the powered wheelchair).

5) Report all incidents of unintended movement or brake release to the powered wheelchair manufacturer, and note whether there is a radio wave source nearby.

**TURN OFF YOUR POWER WHEELCHAIR AS SOON AS POSSIBLE WHEN EXPERIENCING ANY OF THE FOLLOWING:**

1. Unintentional motions.
2. Unintended or uncontrollable direction.
3. Unexpected brake release.

The FDA has written to the manufacturers of power wheelchairs, asking them to test their new products to be sure they provide a reasonable degree of immunity against EMI. The letter says that powered wheelchairs should have an immunity level of at least 30 V/m, which provide a reasonable degree of protection against the more common sources of EMI. The higher the level, the greater the protection.
Driving Outdoors

When driving outdoors, please pay attention to the following:

**NO!**
Do not drive in traffic.

**NO!**
Do not drive beside a river, port, or lake without a fence or railing.

**NO!**
If possible, do not drive during the rain.

**NO!**
If possible, do not drive during or on snow.

**NO!**
Do not drive off-road or on any uneven surfaced roads.

**NO!**
If possible, do not drive at night.
NO!
Make sure that there are no obstacles behind you when in reverse.

We recommend to set the speed at the lowest setting for reversing.

NO!
Do not make sudden stops, weave erratically, or make sharp turns.

NO!
Keep your arms on or inside the armrests and feet on the footrest at all times.

NO!
Do not attempt to climb curbs greater that 1\(\frac{1}{2}\)"(4cm).

NO!
Do not attempt to cross over a gap greater that 3"(7.5cm).
Driving on Various Terrains

Driving up and down ramps or inclines is more dangerous than on level surfaces. If you fail to heed these warnings, a fall, tip-over or loss of control may occur and cause severe injury to the vehicle user or others.

**NO!**
Do not attempt to climb a ramp or incline greater than 6°

**NO!**
Do not reverse while driving up a ramp or incline.
Forward only. If you reverse while moving up a ramp or incline, it may cause the vehicle to tip over.

**NO!**
Do not attempt to drive across a sloping surface greater than 3°
Driving across a slope greater than 3° is very dangerous and may cause the vehicle to tip over.

**NO!**
Do not drive over soft, uneven or unprotected surfaces such as grass, gravel and decks.
**NO!**

Use low speed while driving down ramp.

When braking while moving down ramp, the wheelchair will take longer to come to a complete stop.

**NO!**

Do not get on and off on a ramp.

Always stop on the level surface to get in and get out of the vehicle.

**YES!**

Always climb or descend gradients perpendicular to the slope or ramp.
Familiarize yourself with your powerbase wheelchair

**Feature Diagram**

In this section, we will acquaint you with the many features of your powerbase wheelchair and how they work. Upon receipt of your powerbase wheelchair, inspect it for any damage. Your powerbase wheelchair consists of the following components.

</table>
**Terminology**

**Joystick:** The device used to "move" the powerbase wheelchair.

**Controller:** The device that allows the joystick to function. Not all joysticks have a controller.

**Armrests:** Where arms can rest during time spent on powerbase wheelchair.

**Footrest:** Where feet rest during time spent on the powerbase wheelchair.

**Drive Wheel:** The wheels that move the powerbase wheelchair. These are the main wheels.

**Caster Wheel:** The front wheels and the rear wheels.

**Controller Harness:** Cable connecting the joystick to the controller.

**Freewheel Lever:** For convenience, your powerbase wheelchair is equipped with freewheel levers. These levers allow you to disengage the drive motors and maneuver the chair manually.

---

**WARNING:** DO NOT use the powerbase wheelchair without the presence of an attendant while the drive motors are disengaged! DO NOT disengage the drive motors when your powerbase wheelchair is on an incline, as the chair could roll down on its own, causing injury!

---

To engage or disengage the drive motors:

1. Turn the freewheel levers upward to disengage the drive motors.
2. Turn the freewheel levers downward of the powerbase wheelchair to engage the drive motors.

*Note: It is important to remember that when the powerbase wheelchair is in the freewheel mode, the braking system is disengaged.*
Disassembly of the Powerbase wheelchair

Seat Remove:

1. Disconnect the controller plug. (Fig A)
2. Turn the seat lock-handle up. (Fig B)
3. Lift seat up. (Fig C)
Remove Battery:

(1) Turn the four plastic lock pins then remove shroud. (Fig D.E.F.)
(2) Unfasten the reusable fastener. (Fig G)
(3) Disconnect the battery wire. (Fig H)
(4) Remove the batteries. (Fig I)

---

Seat Height Adjustment:

(1) Hold hexagonal bolt with a 17mm wrench and loosen the nut. (Fig J)
(2) Choose the right height and tighten the bolt.
Armrest Angle Adjustment:

1. Flip up the armrest for easy access.
2. Turn the set screw counter-clockwise to raise the armrest and clockwise to lower the front of armrest (Fig K).

Footrest Angle Adjustment:

1. Flip-up the footplate for easy access (Fig L).
2. With an Allen wrench, simply turn the bolt clockwise to increase the angle or counter-clockwise to decrease it (Fig L).
   (1) Hold hexagonal bolt with wrench and loosen the nut. (Fig L)
   (2) Choose the right angle and tighten the bolt.

Headrest Height Adjustment:

Depress then release the clamp on the left of backrest while pulling headrest up or pushing down until you reach the desired position (one of three). (Fig M)

Joystick Position Adjustment:

Loosen the set screw with allen key and adjust the joystick bar to right position then tighten. (Fig N)
**Manual Freewheel Levers:**

The powerbase wheelchair has a manual freewheel lever on each motor. Manual freewheel levers enable you to disengage the drive motors from the gearboxes and maneuver the chair manually.

**WARNING!** Do not use the powerbase wheelchair while the drive motors are disengaged! Do not disengage the drive motors when the powerbase wheelchair is on an incline, as the unit could roll on its own, causing injury!

To engage or disengage the drive motors:
1. Locate the lever on top of each motor.
2. Push the two levers downward to engage the drive motors. (Fig O)
3. Pull the two levers upward to disengage the drive motors. (Fig P)

If a lever is difficult to move in either direction, slightly rock the powerbase wheelchair back and forth. The lever should then move to the desired position.

**WARNING!** It is important to remember that when your powerbase wheelchair is in freewheel mode, the braking system is disengaged.

---

Fig O. Drive Mode (Drive Engaged)  
Fig P. Freewheel Mode (Drive Disengaged)
2. Adjusting the Driving Speed

The user can adjust the chair's top speed to suit their preferences and environment. The currently selected top speed is shown on the Speedometer and can be adjusted using the "Increase Speed" (Hare) and "Decrease Speed" (Tortoise) buttons.

Each of the speedometer's 6 large LEDs typically represent 0%, 20%, 40%, 60%, 80% and 100% of the chair's absolute maximum top speed.

REMD supports 2 modes of top speed adjustment - "5 Speed" and "VSP" modes.

In the "5 Speed" mode pressing the Increase Speed and Decrease Speed buttons steps between one of the 5 top speeds 20% to 100%.

In the "VSP" mode a quick single press of the Increase Speed and Decrease Speed buttons also steps between one of the 5 speeds 20% to 100%. However, pressing and holding the Increase Speed (Decrease Speed) Button ramps the top Speed up (down) in fine steps, allowing practically any top speed to be selected. This can be particularly useful for matching the chair speed to the walking speed of an accompanying pedestrian.

VSP is an extremely powerful feature, allowing both fast stepping between fixed top speeds by using quick presses or finer control using long presses. The VSP feature can be enabled or disabled. Users can toggle between the "VSP" and "5 Speed" Modes by holding down both the Increase Speed and Decrease Speed Buttons for approximately 2 seconds while the unit is powered up. The control unit will beep when the mode has been changed.
2. Adjusting the Driving Speed

The user can adjust the chair’s top speed to suit their preferences and environment. The currently selected top speed is shown on the Speedometer and can be adjusted using the "Increase Speed" (Hare) and "Decrease Speed" (Tortoise) buttons.

Each of the speedometer’s 6 large LEDs typically represent 0%, 20%, 40%, 60%, 80% and 100% of the chair’s absolute maximum top speed.

REMD supports 2 modes of top speed adjustment - "5 Speed" and "VSP" modes.

In the "5 Speed" mode pressing the Increase Speed and Decrease Speed buttons steps between one of the 5 top speeds 20% to 100%.

In the "VSP" mode a quick single press of the Increase Speed and Decrease Speed buttons also steps between one of the 5 speeds 20% to 100%. However, pressing and holding the Increase Speed (Decrease Speed) Button ramps the top Speed up (down) in fine steps, allowing practically any top speed to be selected. This can be particularly useful for matching the chair speed to the walking speed of an accompanying pedestrian.

VSP is an extremely powerful feature, allowing both fast stepping between fixed top speeds by using quick presses or finer control using long presses. The VSP feature can be enabled or disabled. Users can toggle between the "VSP" and "5 Speed" Modes by holding down both the Increase Speed and Decrease Speed Buttons for approximately 2 seconds while the unit is powered up. The control unit will beep when the mode has been changed.
3. Using the Speedometer

The Speedometer is used to gauge the relative speed of the chair in comparison to the maximum speed possible. The right-most LED indicates current maximum speed, which can be adjusted using the Increase (Decrease) Speed button. Refer to section 2.3 for further details. Using the joystick, as the speed of the chair increases, the LED's will fill in until maximum speed (as displayed) is reached.

If the bottom, left-most GREEN LED is flashing SHARK is in SPEED LIMIT mode, which limits the drive speed to a pre-programmed value, typically when a seat is raised or tilted and driving too fast may be dangerous. Reference your SHARK Power Module Installation Manual for further details.

4. Using the Horn

Press the Horn button.

The horn will sound for as long as the button is pressed.

5. The SHARK Battery Gauge

The Battery Gauge is used to indicate power on (refer 2) and provides an estimate of the remaining battery capacity.

Any green LEDs lit indicate well charged batteries.

If only amber and red LEDs are lit, the batteries are moderately charged. Recharge before undertaking a long trip.

If only red LEDs are lit, the batteries are running out of charge. Recharge as soon as possible.
The following table indicates what the gauge will display for any given state.

<table>
<thead>
<tr>
<th>Display</th>
<th>Description</th>
<th>This means...</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="LEDs OFF icon" /> All LED's OFF</td>
<td>Power is OFF</td>

<td></td>
</tr>
<tr>
<td><img src="image" alt="LEDs flashing slowly icon" /> All LED's flashing slowly</td>
<td>SHARK has detected an Out Of Neutral At Power Up (OONAPU) condition</td>
<td>Release the joystick back to neutral.</td>
<td></td>
</tr>
</tbody>
</table>

6. The REMD Service Indicator Light

The amber Service Indicator LED is dedicated to displaying SHARK Flash Codes. For a list of the Flash Codes and what faults they indicate, Reference Section 5.3.

7. Using the Joystick

Moving the joystick will cause the powerchair to drive in that direction. The amount of joystick movement will determine the speed that the powerchair will move in that direction.
8. The Fault Indicator - Flash Codes

If a fault condition exists, the Fault Indicator LED shows a Flash Code. A flash code is a specific number of short flashes, followed by a pause.

If the fault is a serious fault that prevents the chair from driving, additionally the Battery Gauge shows a "Drive Inhibit" indication.

<table>
<thead>
<tr>
<th>Flash Code</th>
<th>Fault Source</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 1          | Route / Temperature | The motor current has been at the maximum value for too long.  
- The motors may not be strong enough for the chosen route.  
  (the route is too steep).  
  - Turn off the SHARK, let it cool down, then turn it back on and choose another route.  
- The wheels may be rubbing on the frame.  
  - Make sure that the wheels can turn freely.  
- The motors may be faulty.  
  - Have the motor(s) checked by a service technician.  
  The SHARK Power Module is too hot.  
- Wait a few minutes and try again.  
- If this happens often, contact your dealer. |
| 2          | Battery      | The battery voltage is too low or too high.  
- Check the batteries and the cables.  
- Batteries may be empty: charge the batteries.  
- Batteries may be overcharged:  
  - if driving downhill, slow down or turn on the lights, if fitted.  
- Batteries may be damaged: contact your dealer.  
If this fault occurs during battery charging, the battery charger is defective or not adjusted correctly.  
- Contact your dealer.  
If this fault occurs during when you stop or when you travel down a slope, and the batteries are not full, the battery connector may make intermittent contact.  
- Check the battery cables and connectors. |
| 3          | Motor 1 (right) | The motor is not connected to the SHARK, or there is a short-circuit in the motor connection.  
- The motor brushes may have lost connection, turn the wheels of the chair to reconnect the motor brushes, and then turn the SHARK off and on.  
- If this happens often, the motors may be faulty.  
- Check that the motor cables are not loose or damaged.  
- Contact your dealer. |
| 4          | Motor 2 (left) | The motor is not connected to the SHARK, or there is a short-circuit in the motor connection.  
- The motor brushes may have lost connection, turn the wheels of the chair to reconnect the motor brushes, and then turn the SHARK off and on.  
- If this happens often, the motors may be faulty.  
- Check that the motor cables are not loose or damaged.  
- Contact your dealer. |
| 5          | Parkbrake 1 (right) | The parkbrake has been released manually.  
- Enable the parkbrake, and then turn the SHARK off and on.  
The parkbrake is not connected to the SHARK, or there is a short-circuit in the parkbrake connection.  
- Check that the motor cables are not loose or damaged.  
- Contact your dealer. |
| 6          | Parkbrake 2 (left) | The parkbrake has been released manually.  
- Enable the parkbrake, and then turn the SHARK off and on.  
The parkbrake is not connected to the SHARK, or there is a short-circuit in the parkbrake connection.  
- Check that the motor cables are not loose or damaged.  
- Contact your dealer. |
| 7          | Missing Power Module | A communication error between the Remote and the Power Module.  
- Batteries may be completely empty: charge the batteries.  
- Batteries may be damaged: contact your dealer.  
- Check that the SHARK Bus cable is not loose or damaged.  
- Contact your dealer. |
| All Others | Internal fault | Contact your dealer. |

These flash code descriptions are aimed at end users. For a more detailed flash code description see the installation manual of the SHARK Power Module.
Dynamic Shark Controller Operation:

**Shark Controller Introduction**

**The Shark Controller Unit**

- Specially designed with the user in mind, the knob perfectly completes the well-proven Dynamic Joystick.
- Horn button
- The SHARK information Gauge is the source for all user information
- On/Off button
- Ergonomic and functional speed control dial
The Shark Information Gauge

The SHARK Information Gauge is the primary source of user feedback. It displays every possible status that SHARK may have, including:

- **SHARK Power ON**
  
  True state-of-battery-charge, including notification of when the battery desperately requires charging.

  - *Any green* LED's lit indicates well-charged batteries.

  - If *only amber and red* LED's are lit, the batteries are moderately charged. Recharge before undertaking a long trip.

  - If *only red* LED's are lit, the batteries are running out of charge. Recharge as soon as possible.

- **SHARK Lock Mode countdown**

- **Program, inhibit or charge modes**

- **Fault indication (Flash Codes)**
The following table indicates what the gauge will display for any given state.

The Shark Communications Bus

The SHARK Power Module communicates to the Control Unit through the SHARK Communications Bus. The Bus also supplies power to the Control Unit. The connector is 'keyed' and can only be plugged in one way - the control Unit symbol on top of the plug should be facing up.
Turning the Power ON

Press the Power button.

All indicators will light briefly.

Either the current battery charge or Lock Mode will then be indicated.

Turning the Power OFF

Press the Power button.

The LED's will turn off.

The Power button can also be used to turn SHARK off in case of an emergency.
After a certain amount of time with no joystick movement SHARK will automatically turn itself off. Sleep mode will not be entered while programming.

Any button press (or joystick movement if Wakeup style has been set to "Joystick or Button") will bring the system out of sleep mode.

Moving the joystick will cause the powerchair to drive in that direction. The amount of joystick movement will determine the speed that the powerchair will move in that direction.

A user may adjust the top speed of their powerchair to suit their preference or environment by turning the speed control dial.

Simply turn the dial fully clockwise to travel at top speed when the joystick is pushed fully forward. The top speed progressively reduces as the dial is turned counter-clockwise.

Press the Horn button.

The horn will sound for as long as the button is pressed.
Flash codes indicate the nature of an abnormal condition directly from the SHARK Information Gauge. Without the use of any servicing tools, the condition can be simply diagnosed.

VR2 Controller Operation:
The VR2 control system has two versions of the front control panel - with and without actuator control. Most of the controls are common to both versions, however, the actuator buttons are only included on VR2 control systems with seat actuator control. Each of the controls are explained within this section.

Actuator Buttons
On/Off Button and Battery Gauge

The on/off button applies power to the control system electronics, which in turn supply power to the wheelchair's motors. Do not use the on/off button to stop the wheelchair unless there is an emergency. (If you do, you may shorten the life of the wheelchair drive components.)

The battery gauge shows you that the wheelchair is switched on. It also indicates the operating status of the wheelchair. Details are given in section 1.

1 Control System Status indication

The battery gauge and maximum speed/ profile indicator show the status of the control system.

A number of supposedly defective control systems returned to us are subsequently found to operate correctly. This indicates that many reported faults are due to wheelchair problems rather than the control system.

1.1 Battery Gauge is Steady

This indicates that all is well.

1.2 Battery Gauge Flashes Slowly

The control system is functioning correctly, but you should charge the battery as soon as possible.

1.3 Battery Gauge Steps Up

The wheelchair batteries are being charged. You will not be able to drive the wheelchair until the charger is disconnected and you have switched the control system off and on again.

1.4 Battery Gauge Flashes Rapidly (even with the joystick released)

The control system safety circuits have operated and the control system has been prevented from moving the wheelchair.

This indicates a system trip, i.e. the VR2 has detected a problem somewhere in the wheelchair's electrical system. Please follow this procedure.

- Switch off the control system.
- Make sure that all connectors on the wheelchair and the control system are mated securely.
- Check the condition of the battery.
- If you can't find the problem, try using the self-help guide given in section 1.6.
- Switch on the control system again and try to drive the wheelchair. If the safety circuits operate again, switch off and do not try to use the wheelchair.

Contact your service agent.

1.5 Self-Help Guide

If a system trip occurs, you can find out what has happened by counting the number of bars on the battery gauge that are flashing.
Below is a list of self-help actions. Try to use this list before you contact your service agent. Go to the number in the list which matches the number of flashing bars and follow the instructions. If the problem persists after you made the checks described above, contact your service agent.

* If the programmable parameter, Motor Swap has been enabled, then left and right hand references in this table will need transposing.

1 Bar

The battery needs charging or there is a bad connection to the battery. Check the connections to the battery. If the connections are good, try charging the battery.

2 Bar

The left hand motor* has a bad connection. Check the connections to the left hand motor.

3 Bar

The left hand motor* has a short circuit to a battery connection. Contact your service agent.

4 Bar

The right hand motor* has a bad connection. Check the connections to the right hand module.

5 Bar

The right hand motor* has a short circuit to a battery connection. Contact your service agent.

6 Bar

The wheelchair is being prevented from driving by an external signal. The exact cause will depend on the type of wheelchair you have, one possibility is the battery charger is connected.

7 Bar

A joystick fault is indicated. Make sure that the joystick is in the center position before switching on the control system.

8 Bar

A control system fault is indicated. Make sure that all connections are secure.

9 Bar

The parking brakes have a bad connection. Check the parking brake and motor connections. Make sure the control system connections are secure.

10 Bar

An excessive voltage has been applied to the control system. This is usually caused by a poor battery connection. Check the battery connections.

7 Bar + S

A communication fault is indicated. Make sure that joystick cable is securely connected and not damaged.

8 Bar + A

An Actuator trip is indicated. If more than one actuator is fitted, check which actuator is not working correctly. Check the actuator wiring.
1.6 Slow or sluggish movement
If the wheelchair does not travel at full speed or does not respond quickly enough, and the battery condition is good, check the maximum speed setting. If adjusting the speed setting does not remedy the problem then there may be a non-hazardous fault. Contact your service agent.

1.7 Maximum Speed / Profile Indicator is Steady
The display will vary slightly depending on whether the control system is programmed to operate with drive profiles.

1.7.1 Maximum Speed Indication
The number of LEDs illuminated shows the maximum speed setting. For example, if the setting is speed level 4, then the four left hand LEDs will be illuminated.

1.7.2 Profile Indication
The LED illuminated shows the selected drive profile. For example, if drive profile 4 is selected, then the fourth LED from the left will be illuminated.

1.8 Maximum Speed / Profile Indicator Ripples Up and Down
This indicates the control system is locked.

1.9 Maximum Speed / Profile Indicator Flashes
This indicates the speed of the wheelchair is being limited for safety reasons. The exact reason will depend on the type of wheelchair, however, the most common cause is that the seat is in the elevated position.
Operating your powerbase wheelchair

Batteries and Charging

Your Power Wheelchair uses two long-lasting, 12-volt batteries. These batteries are sealed, maintenance free, deep-cycle batteries. Since they are sealed, there is no need to check the electrolyte (fluid) level. Deep-cycle batteries are designed to handle a deep discharge. Though they are similar in appearance to automotive batteries, they are not interchangeable. Automotive batteries are not designed to handle a long, deep discharge, and are also unsafe for use in power wheelchairs.

WARNING! Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.

BATTERY BREAK-IN
To break in your power wheelchair new batteries for maximum efficiency:
1. Fully recharge any new battery prior to initial use. This will bring the battery up to about 90% of its peak performance level.
2. Run your power wheelchair about the house and yard. Move slowly at first, and do not stray too far until you become accustomed to the controls and break in the batteries.
3. Give the batteries another full charge of 8 to 14 hours and operate the power wheelchair again. The batteries should now perform at over 90% of their potential.
4. After four or five charging cycles, the batteries will top off at 100% charge and last for an extended period.

IMPORTANT INFORMATION ABOUT BATTERIES
A fully charged deep-cycle battery provides reliable performance and extended battery life. Keep your batteries fully charged whenever possible. Batteries that are regularly discharged, infrequently charged, or stored without a full charge may be permanently damaged, causing unreliable operation and limited battery life.

If you do not use your power wheelchair regularly, we recommend maintaining battery vitality by charging the batteries at least once a week.

Note: If you are storing a power wheelchair for an extended period of time, you may wish to block the unit up off the ground with several boards under the frame.
This keeps the tires off the ground to prevent the possibility of flat spots developing.

If you intend to use public transportation while using your power wheelchair, you must contact the transportation provider in advance to determine their specific requirements.

Sealed Lead Acid and Gel Cell batteries are designed for application in wheelchairs and in other mobility vehicles. Generally, Sealed Lead Acid batteries that are marked as "Non-Spill" are safe for all forms of transportation such as aircraft, buses, and trains. We suggest that you contact your transportation provider to determine specific requirements of transportation and packaging.

If you wish to use a freight company to ship the power wheelchair to your final destination, repack the power wheelchair in the original shipping container and ship its batteries in separate boxes.

**Charging Your Batteries**

The battery charger is one of the most important parts of your power wheelchair. Optimize your power wheelchair performance by charging the batteries safely, quickly, and easily. Use only the charger supplied with the vehicle.

**Charging Procedures**

1. Keep charger output plug inserted into the charging socket in the front of the controller before having the charger input plugged into an electrical outlet.
2. Follow the instructions on the front panel of the charger for operating and learn the meanings of the different indicators accordingly.
3. Minimum charging time varies depending on battery condition and discharge level. It is recommended to charge the batteries overnight.

**NOTE:** The specially designed charger assures that excess power is not consumed regardless of how long it is switched on, and connected to the batteries.

4. Once charging is complete, disconnect the charger from the electrical outlet and then disconnect the charger from the controller socket. Do not leave the charger connected to controller when input power is disconnected. It is dangerous and will jeopardize the power charging to the batteries.

Degree of protection against ingress of water is rated as IPx0.

Serialization format for products

S/N : 4090003

1. The first digit is the last one digit of the year for manufacture.
2. The second and third digits are the month for manufacture.
3. The fourth to seventh digits are a count of how many units were manufactured during the month.
Warranty

Limited Warranty

Corporation warrants to the original purchaser of this wheelchair product that it is free of defects in material and workmanship and that, when operated within the guidelines and restrictions of this manual, will remain so free of defects in material and workmanship for a period of One (1) year from the original date of purchase.

Excluded from this warranty is failure due to negligence, abuse, accident, operation outside of rated limits, commercial or institutional use, damage / wear to upholstery or tires and improper maintenance or storage. The batteries for this wheelchair product are not supplied by Corporation; contact the battery manufacturer / supplier if warranty replacement is requested.

This wheelchair product must not be modified in any way without the express written consent of Corporation. Any such unauthorized modification could cause unreliable and / or unsafe operation and will void this warranty.

Where a failure occurs within the 1-year warranty period that is not excluded above, the failed components will be replaced with similar new or reconditioned components at sole option. Corporation will not be responsible for labor and / or shipping charges.

The foregoing warranty is exclusive and in lieu of all other warranties expressed or implied including, but not limited to, the implied warranty of merchantability and fitness for a particular purpose. Corporation will not be liable for any consequential or incidental damages whatsoever.

TROUBLESHOOTING TIPS

If your power chair or scooter is not operating properly, please take the following steps prior to calling Technical Support.

Load-test Batteries—See Figure 1

1. Attach Battery Load-tester to battery.
   Observe polarity: Red is Positive—Black is Negative

2. Hold load switch on for 10 seconds. A good reading is 11.2 Volts DC, or in the Green.

Note: A Voltmeter cannot load-test batteries.

Test Voltage—See Figure 2

Utilizing a Voltmeter, place meter leads in charging port. The voltage reading should be 25 Volts DC, plus or minus 2 volts.

Note: Batteries are connected in series.

If the above tests are successful, proceed with the following test.

1. For power chairs, place gearbox levers in Freewheel.

2. Turn on controller and run in all four quadrants.

3. If troubleshooting a scooter, elevate rear wheels and run in Forward and Reverse.

If any of the tests fail, call Technical Support for assistance: 1-800-963-7487.
